

As patterns of ice loss around Antarctica become more uniform, there is an underlying increase in carbon capture-to-storage-to-sequestration on the seafloor. The amount of carbon captured per unit area is increasing and the area available to ...

If immobilized biological carbon is the focus for marine CO<sub>2</sub> removal (estimated by Henley et al., 2020, at 12% primary productivity, 22.8 g C m<sup>-2</sup>), then across the Antarctic shelf, 100.32 ± 10.6 t C y<sup>-1</sup> held in medium term (tens to hundreds of years) storage, is valued at \$17.05 billion. These values will continue to grow each year ...

In this study, the combination of petrology, CO<sub>2</sub> content trapped in bulk rock- and mineral-hosted fluid inclusions (FI), and 3D textural and volumetric characterization of intra- ...

The densest water created - Antarctic Bottom Water - spreads out to flood the global abyss. Its formation and spreading represents an efficient mechanism for carbon sequestration
