

# Can scattered light be used for solar power generation

How does a solar panel work if the sky is clear?

The light leakage from the Fresnel lens structure and the scattered light from the sunlight passing through the clouds can be directed to the polycrystalline silicon-based solar panel (PSSP) for power generation. When the sky is clear, the light is concentrated on the high-efficiency solar cell, so the power generation efficiency is high.

Can solar panels be used for power generation?

In addition, from a power generation point of view, we can also use low-cost solar panels to lay in the leakage area for power generation, so we designed a power generation installation that combines the advantages of both HCPV and polycrystalline solar panels.

What is concentrated solar power & how does it work?

Concentrated solar power (CSP), including concentrated photovoltaics (CPV) depend on direct rays. Ordinary photovoltaics do not; they generate electricity from light however it comes in; reflected off snow, or scattered by the atmosphere and by clouds. And you can find light like that all around the world.

How do different angles affect the performance of solar cells?

Different angles and different light intensities have different effects on the performance of solar cells. When the light is radiated to the photovoltaic cell material, some of the incident light is reflected or scattered on the surface, and some of it is absorbed by the photovoltaic cell.

Does light intensity affect the performance of solar energy generation?

In the experimental study of the influence of light intensity on the performance of solar energy generation of trough photovoltaic cells, the trough concentrated photovoltaic power generation system with high cost performance is used, as shown in Figure 2. Trough type concentrating photovoltaic power generation system.

How do solar panels work?

First, light energy from the sun strikes the surface of the active material that makes up the solar cells (typically a semiconductor made from silicon). This excites electrons in the material, which we then capture as electricity. You might think that solar panels would work best in summer, when there's more sunshine.
