

What is grounding system testing?

Grounding system testing is performed in and around high voltage (HV) substations to ensure personnel safety in the event of a system fault.

Can continuity testing be performed at a power installation?

While continuity testing can be performed at any power installation this paper concentrates specifically on the integrity assessment of a major substation.

What is a substation integrity test?

The integrity test is used to detect any bad connection, open circuit, or isolated structure or equipment in a substation grounding system. According to the standard IEEE Std 80-2000, a typical test set should contain the current source up to 300 A, voltage and current measurement channels, and two test leads.

What is a ground grid integrity test?

The ground grid integrity test is the most relevant test method/technique for measuring the electrical characteristics of the substation grounding system.

Why is a grounding system important?

Grounding systems are essential for the safe and reliable operation of electrical power systems. In the event of a ground fault, improperly designed or deteriorated ground-ing systems can have a major impact on: The ground potential rise due to the fault can cause hazardous step & touch voltages in and around the grounding system.
