

## Excitation of squirrel cage generator in wind power

Can squirrel cage induction generator be used in small scale wind generating systems?

In spite of availability of modern generators, Squirrel Cage Induction Generator (SCIG) as a micro grid component may still be a promising generator in small scale wind generating systems. However, reactive power demand for excitation is a big challenge for the smooth functioning of SCIG.

Is a squirrel cage induction generator a nonlinear dynamic system?

Therefore,the aim of the thesis is to provide a better understanding of the behaviour of a smooth airgap,self-excited,squirrel cage induction generator as a nonlinear dynamic systemwhen operating under a variety of load conditions,which would hopefully contribute to the development of a better regulated/controlled,viable SEIG system.

Can a self-excited squirrel cage induction machine operate in grid connected mode?

This paper presents the controller design of a wind energy conversion system built around a self-excited squirrel cage induction machine that can be operated in both standalone and grid connected modes. The control scheme regulates the machine terminal voltage in the standalone mode and the grid side reactive power in the grid connected mode.

What is self excited squirrel cage induction generator (Seig)?

This fast development has attracted many researchers and electrical engineers to work on this field. Self excited squirrel cage induction generator (SEIG), which uses an excitation capacitor, is used widely to convert mechanical wind energy to electricity, due to their low cost, small size, no need of separate dc source and brushes.

Can an induction machine operate as a self-excited induction generator (Seig)?

It is possible for an induction machine to operate as a Self-excited Induction Generator (SEIG) if capacitors are connected to the stator terminals in order to supply the necessary reactive power to achieve generating electrical energy in remote areas.
