Does inlet air cooling increase power output of a gas turbine?

The simulation results showed that the utilization of inlet air cooling can increase power output and lower the gas turbine's heat rate. The maximum net power output obtained from the utilization of mechanical chiller technology was 8.46%. The performance of gas turbines is greatly affected by ambient temperature.

Does an inlet air cooling system improve power output and efficiency?

Still, the results indicate that the power output and efficiency of the gas turbine improved as long as the ambient temperature remained at their lower values. Because of this, the incorporation of an inlet air cooling system could mitigate the negative influence of high temperatures in tropical locations.

Can Inlet air cooling improve the performance of intercooled gas turbine power plants?

In hot climates, the entry of high-temperature air into the compressor of intercooled gas turbine power plants (IcGTCC) can lead to reduced electricity production during peak demand periods. To address this issue, this study proposes a novel inlet air cooling (IAC) system for improving the performance of IcGTCC in hot regions.

Can a novel inlet air cooling system increase power output?

A novel inlet air cooling system for intercooled gas turbines is proposed. The proposed system is able to increase power output by 19% and efficiency by 2.3%. The novel system offers 8-18% better efficiency than existing designs in literature. The new system generates substantial annual profits.

Does compressor inlet air temperature affect gas turbine performance?

The maximum net power output obtained from the utilization of mechanical chiller technology was 8.46%. The performance of gas turbines is greatly affected by ambient temperature. Several studies on the effect of compressor inlet air temperature on gas turbine performance have been conducted.

What are inlet air cooling technologies?

Inlet air cooling technologies such as evaporative cooling, high pressure fogging, and absorption chiller cooling; in a power plant produce 1-15% higher power output than that without inlet air cooling [,,,]. Combined heat and power (CHP) or cogeneration is a well-known solution to counteract ambient temperature effects.
