How is a wind power plant connected to a high voltage grid?

Onshore and offshore large-size wind power plants are usually connected to high voltage or very high voltage grids. Figure 2 shows a typical connection scheme to a high voltage grid for a wind power plant onshore, whereas Figure 3 shows the scheme of connection to the electric grid of a wind power plant offshore through a HVDC electric cable.

Can wind energy be integrated into the grid?

Kook et al. (2006) examined potential mitigation techniques to reduce the level of impacts associated with integrating wind energy into the grid by implementing an energy storage system (ESS) using a simulation model implemented using the Power System Simulator for Engineering (PSS/E).

How can wind power plants improve microgrid performance?

Wind power plants can be integrated with demand side management strategies to improve microgrid system's performance and reduce cost of generation. Small-scale low power wind turbines are being installed in high rise buildings to generate electric power in locations with very good wind contour profiles.

How do wind power plants work?

Wind power generation plants are usually inserted in the electric power system by connection to the primary distribution section or, in case of small plants, to the secondary distribution section. Onshore and offshore large-size wind power plants are usually connected to high voltage or very high voltage grids.

How does a wind farm integrate with a power grid?

Extensive integration can occur when many small wind farms are connected to a distribution grid in one area of the power system. In addition, a large wind farm is connected to the transmission grid. The power industry faces one of its biggest challenges when effectively incorporating wind energy into the grid.

Why do wind power plants need energy storage systems?

An energy storage system is needed in a wind energy integration system to solve problems such as peak demand loading, wind fluctuations, and system dynamics (Devaraj and Jeevajyothi 2011). Some transmission system operators and utility engineers are still concerned about wind power plant interconnection.
