What are the different types of thermal energy storage systems?

Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage. Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying.

What is the basic principle of thermal energy storage?

The basic principle is the same in all TES applications. Energy is supplied to a storage system for removal and use at a later time. What mainly varies is the scale of the storage and the storage method used. The process of storing thermal energy can be described in three steps, referred to as a cycle.

How is thermal energy stored?

Thermal energy can generally be stored in two ways: sensible heat storage and latent heat storage. It is also possible to store thermal energy in a combination of sensible and latent, which is called hybrid thermal energy storage. Figure 2.8 shows the branch of thermal energy storage methods.

What are thermal energy storage materials for chemical heat storage?

Thermal energy storage materials for chemical heat storage Chemical heat storage systems use reversible reactions which involve absorption and release of heat for the purpose of thermal energy storage. They have a middle range operating temperature between 200 °C and 400 °C.

What are thermal energy storage methods?

Thermal energy storage methods can be applied to many sectors and applications. It is possible to use thermal energy storage methods for heating and cooling purposes in buildings and industrial applications and power generation. When the final use of heat storage systems is heating or cooling, their integration will be more effective.

How a thermal energy storage system works?

For example, if the aim of the thermal energy storage is to store solar energy, charging period will be the daytime for daily storage and the summer for seasonal storage. The solar energy is converted to the heat in solar collectors and charged into a storage medium like water, rock bed, phase change material, etc.
