What is lightning induced voltage in a photovoltaic system?

Simulation of surges in a photovoltaic system Lightning induced voltages in DC cables is one of the critical issues in lightning protection of PV systems. This voltage may damage the inverter connected to the DC cable. The induced voltage on the PV panel could damage bypass diodes connected to the panel as well.

What happens if lightning strikes a PV module?

The loop formed by the DC cables in the PV module can generate an induced voltage that is high enough to damage the bypass diodes during lightning strikes. The bypass diodes do not have any specific protection measures against lightning. When lightning strikes a PV system or a structure nearby, the ground potential will rise to a high level.

What influences Lightning transient overvoltage in a PV system?

The influences of the lightning current waveform, soil resistivity, and height of the tower on the lightning transient overvoltage in the PV system are discussed. Both scenarios studied above (lightning strikes to the transmission line and strikes to the tower) are considered.

Can lightning damage a PV system?

For renewable systems, most of the work investigates the lightning threats to wind turbines, while, the work related to the lightning protection of PV systems is still limited. Both direct and indirect lightning strikes can bring severe damage to the PV panels or other devices in PV plants.

What causes system failures in PV plant during a lightning strike?

System failures in the PV plant during a lightning strike may be caused by the failure of PV inverters, breakdown of bypass diodes, arcing between PV frame and wires, and others. A power inverter plays a vital role in energy conversion in the PV system. It transforms the DC power generated by the PV modules into three-phase AC power.

Does a PV plant withstand a lightning strike?

The withstand voltage is generally linearly proportional to the number of bypass diodes connected in series. This paper investigated the transient behaviors of a PV plant during a lightning strike to the transmission line nearby. With the PEEC method, lightning-induced voltages in the PV system were simulated.
