How do you design a solar water pumping system?

When designing a solar pumping system, the designer must match the individual components together. A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1.

What are the components of a solar water pumping system?

A solar water pumping system consists of three major components: the solar array,pump controller and electric water pump (motor and pump)as shown in Figure 1. Note: Motor and pump are typically directly connected by one shaft and viewed as one unit,however occasionally belts or gears may be used to interconnect the two shafts.

What is a solar water pump?

A solar water pump theoretically consists of three key components: a pump control system that may be just an on-off switch or may be a more complex electronic unit, a motor and the pump; however, in practice they are considered as one unit and generally called the "water pump" or in this guideline the "solar water pump".

How to choose a solar water pumping system?

The type of solar water pumping system: borehole/well (submerged),floating or surface will depend on the water source. If the source is a borehole (proposed or existing) or deep well,then a submersible pump that fits the borehole or well should be selected. If the water source is a river,then a surface pump should usually be selected.

How does a solar powered water system work?

However, it is important that the solar powered water system is designed to supply only the amount of water intended to be collected from the system. In this community, people will collect all their water used for drinking and cooking from the system.

What data should be included in a solar water pump design?

The specific data would be the size of the inlet and outlet that the water pipe would be connected to. Figure 14 a,b and c shows key dimensions of the three water pumps shown in Figure 13 and used in the solar water pumping systems used in Table 7. The designer should initially use pipe that is the same size as the inlets and outlets.
