

Can solar energy be used for different applications in Palestine?

These values are encouraging to exploit the solar energy for different applications. This study highlights that the main renewable energy sources in Palestine are solar energy, wind energy and biomass, thereby the energy dependence on neighbouring countries may significantly decrease, when Palestine uses the available renewable energy sources.

How can Palestine reduce its reliance on imported energy carriers?

Palestine can reduce reliance on imported energy carriers by deployment of clean energy systems, especially solar, geothermal and biomass. Palestinian areas has large alternative energy potential which can be harnessed by a futuristic energy policy, large-scale investments and strategic assistance from neighbouring countries like Jordan and Egypt.

What is the future of solar energy in Palestine?

Solar energy can be a major contributor to the future Palestinian energy supply, with its high potential in the area. Palestine receives about 3,000 hours of sunshine per year and has an average solar radiation of 5.4 kWh/m. Domestic solar water heating (SWH) is widely used in Palestine where almost 70% of houses and apartments have such systems.

How to reduce energy consumption in Palestine?

Recently, after the evolution of increasing oil prices, energy has become another major challenge to sustainable development for Palestinian. Thus, the other main goal to achieve is to reduce the energy consumption in Palestine, these can be done by the development of a clear energy conservation and regulation policy.

What is the energy problem in Palestine?

The energy problem in Palestine is one of many issues that affect the social and economic conditions of the Palestinian people. The fact that most of the energy is imported at relatively high prices places more financial burdens on poor and marginalized people.

Does Palestine have solar energy?

Solar energy Palestine has high solar energy potential about 3000 sunshine hours per year and high annual average of solar radiation amounting to 5.4 kW h/m²/day on horizontal surface.
