How do you tie a generator pulley?

Remove the generator's starter to access the rope inside it. Pull out the rope to access the knot used to tie it to the pulley. Lock the pulley into place by inserting a screwdriver inside it. Make sure it doesn't unwind since you'll be needing the end with the knot.

How does a recoil spring & pull cord work?

The pull cord and the recoil spring are housed in a pulley on the side of the generator. The pull cord is wound around the outside of the pulley in one direction. A wound recoil spring is then mounted inside the pulley. This setup ensures that pulling on the pull cord unwinds the pulley and the recoil spring.

Why is my pull cord not retracting back into the recoil hub?

The reasons your pull cord can't retract back into the recoil hub include the following: The pull cord and the recoil spring are housed in a pulley on the side of the generator. The pull cord is wound around the outside of the pulley in one direction. A wound recoil spring is then mounted inside the pulley.

How do you start a generator with a recoil spring?

Release the pulley by pulling out the screwdriver while holding onto the rope. The recoil spring should pull the new cord inside it. Pull it out slowly then release to gauge if it works correctly this time. Put back the covers of the pulley and the starter then start the generator engine.

How do you start a generator with a pull cord?

Your generator has a pull cord which is one way of starting the generator. In fact, a majority of the generators on the market use this pull cord with a few using a key, switch or remote device. The pull cord has a T-shaped handle which juts outside of the pull cord hub and makes part of the starter recoil setup.

What happens if a generator pulls out?

In normal operation, the pull cord should come out when pulled and retract when released. This is made possible by a combination of springs that pull back the pull cord after being pulled out. In some cases, however, the pull cord may fail to retract. This prevents it from being used to start the generator again.
